Brokers on the possibilities of AI

> "Predicting the outcomes will be more precise for the carriers."

> "Understanding the targeted consumer or employee will be a lot easier and quicker."

> "AI should serve the people who serve employees, not necessarily be employee facing."

Based on a recent EY-Parthenon workforce benefits GenAI survey

92%

of group benefits carriers surveyed stated they have dedicated and/or mobilized teams to focus on GenAI initiatives.

46%

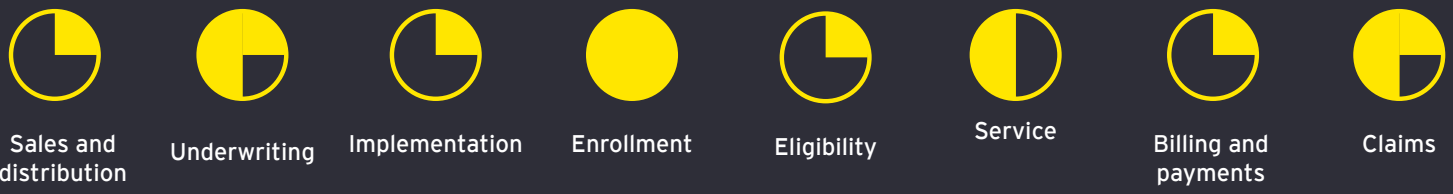

of carriers expect AI/GenAI to drive 5%–10% revenue uplift.

62%

of group carriers are deliberately targeting distinct portions of the value chain to drive value.

Majority of brokers believe AI will drive disruption, but in targeted areas

Our interviews also confirmed the usefulness of AI tools across the benefits lifecycle. *See sidebar.* The consensus among brokers is that AI tools will make claims processes faster, with the potential for more accurate and appropriate decision-making and tailored recovery plans. Brokers can also see how AI-enabled bots can perform key service tasks. But they were quick to note that many employees will want to talk to a real person or human agent in key moments that matter like death claims. Therefore, it's critical to design service processes to keep a human in the loop to make the most of AI investments.

Beyond optimizing key processes, there is widespread recognition that AI's biggest contribution to future success will be in enabling a fully connected and integrated experience. One broker described the big-picture goals as, "shifting the conversation from the basics of claims adjudication to integrating across product portfolios." Another spoke of future possibilities: "AI will be a part of every vendor's playbook to move education from 'what these benefits can be' to 'how do we make this work?' to 'what can we do?'"

As products expand and AI solutions emerge, connected experiences will be critical. "A single front door must be in place to go for everything," observed one broker. "Disconnected experiences will fail in the future."
